The **Product Owner** (or Product Associate) adds
and prioritizes features in the backlog

Completed features are removed by
the **Product Owner** after verification

Application Startup

The users starts the application, and sees a splash page that includes our company logo.

The first page after that has two buttons, "register" and "login". Registration is just an email and password, you can confirm your email any time within 10 days.
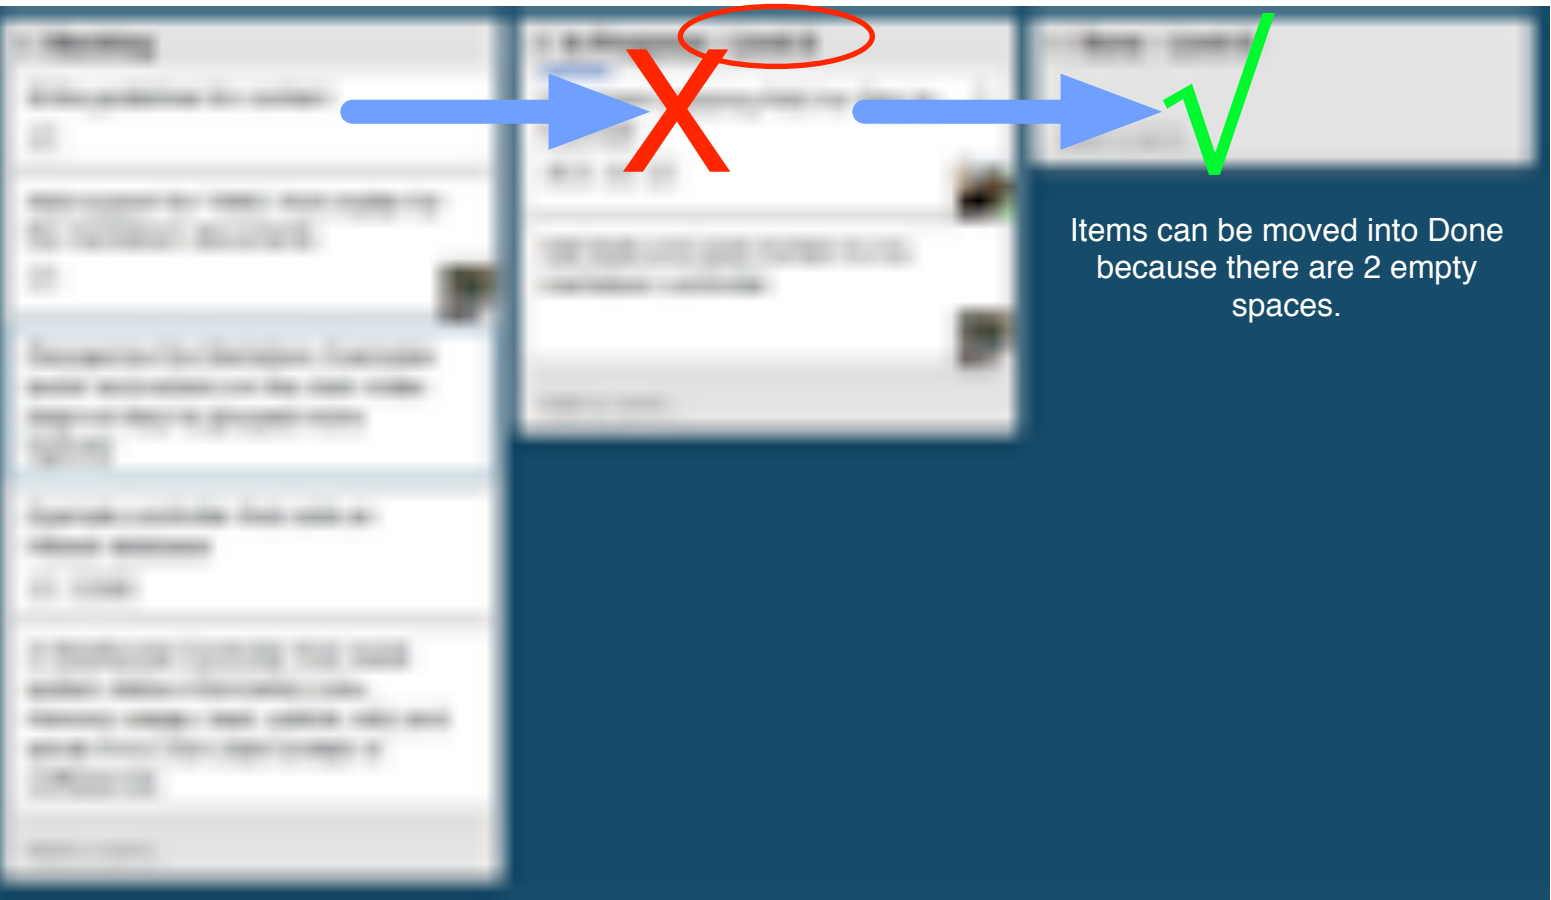

Once logged in you reach the dashboard (TBD).
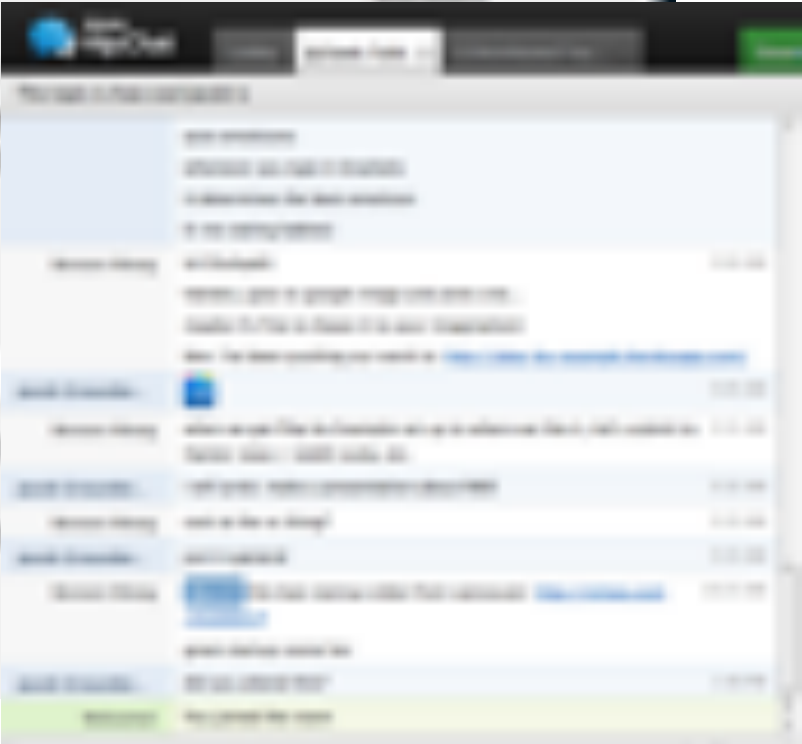

Edit the card description.

The **Development Team** moves features through the pipeline,
taking the top most feature from the backlog and completing
it over the course of 3-4 days.

A new item cannot be moved from the backlog because the **In Progress** limit has already been reached

Items can be moved into Done because there are 2 empty spaces.

The PO can solicit information from the development team by linking to the card from chat, with a question

Is this reasonable to place in a single feature?
